1 SYSTEM REQUIREMENTS

Functional Requirements: The customer can buy furniture and query the status of the product. Administrator can add or remove branch. Also can add branch employee to branch or remove branch employee from branch. Branch employee can add customer to the system or remove customer from the system. And also branch employee can modify product information. Administrator can add employee personnel to the system or can remove from the system. employee can modify product information.

Non-Functional Requirements:

The furniture company has employees. These are administrator, branch employee personnel. In addition, the company may have branches and customers. Branch employees are belong to branches, not to the company. Each branch has furniture sent by the user.

2 Use Case Diagram

3. CLASS DIAGRAMS

My Class Diagram in "ClassDiagram.pdf" . Please check it.

4. PROBLEM SOLUTION APPROACH

My Problem solution steps are;

- Specify the problem requirements
- Analyze the problem
- Design an algorithm and Program
- Implement the algorithm
- Test and verify the program
- Maintain and update the program

1) Specify the problem requirements : I understand the problem.

2) Analyze the problem : I identify; – Input data – Output data – Additional requirements and constraints

3) Design an algorithm and Program : I divide the problem into sub-problems. I listed major steps (sub-problems). I break down each step into a more detailed list. To do these We have to divide this big project into small pieces. First of all I started with user type we need divide them with separate classes. And then to handle all data we need to write a class that manipulate the data. And lastly if we combine all these we can complete the project.

4) Implement the algorithm : I wrote the algorithm in Java by converting each step into statements of Java (classes ,methods etc.) First I wrote the User Interface I put the common operation among the users. Then I wrote User Class that implements the user interface and I put common things among users type in this class then I wrote the Classes for each user type such as administrator that extends from user class. Then also I wrote Data class to keep and operate my all data about the data. Then Since administrator and Branch employee has several tasks I wrote manipulate administor and manipulate branch employee array. Since we have more than 1 menu in our program I wrote Menu interface and Menu classes that implements this interface. Lastly I merge all this classes in main class.

5) Test and verify the program: I run the program for several input cases.

6) Maintain and update the program : I keep the program up-to-date.

6. TEST CASES

Main Menu

```
